Use of Underwater Dry Welding for In-Situ Repair to Offshore Structures

Sabine Powell
engineering@neptunems.com
02/12/2016
In-Situ Welding

- Steel Structures

- Suitability of Repair Methods

- Mobile Offshore Units
  - Dry Docking Schedule (Inspection and Repair)
  - Underwater Inspection In-Lieu of Dry Dock (UWILD)

- Fixed Offshore Units
Difficulties in Welding

- Welding Challenges
- Diver and Operational Challenges
Welding Challenges

- Water
  - Rapid Cooling Rates
  - Hydrogen
  - Cracking

- Ambient Pressure
  - Porosity

- Material
  - Higher carbon content (Older)
  - Alloyed Steels

Operational Challenges

- Welder Challenges
  - Environment
    - Sea state and current
    - Visibility
  - Weld Location
    - Access to Weld Area
    - Fatigue
  - Technique

- Repair Time Challenges
  - Diving weather window
  - Depth limited dive time
Welding Codes

- Welding Procedure Specification

- Classification Body Codes
  - DNV GL
  - ABS
  - Lloyd’s Register
  - Bureau Veritas

  - Weld Classification
    - Class A – suitable for comparable applications to surface welding
    - Class B – suitable for less critical applications and fitness for purpose
    - Class O – meet additional code or standard requirements
Welding Procedure Specification

A document which outlines the steps to be followed to produce a weld with the required properties.

Some Essential Variables:

- Depth
  - Ambient Pressure
- Steel chemical composition (Carbon and Carbon Equivalent)
  - Hardenability (350HV10)
- Welding consumables
- Pre- and Post- Heating
## Weld Classes

<table>
<thead>

Methods of Underwater Welding

Wet Welding
- Welding arc and weld is not separated from the water

Dry Spot Welding – NEPSYS
- Weld is separated from the water
- Diver is separated from the water

Hyperbaric Welding
- Weld is separated from the water
- Diver is not separated from the weld
## Welding Method Comparison

Habitat which isolates the weld area is designed.
- Accommodates the geometry of the area surrounding the weld
- Incorporates windows for visibility and access to the weld

Heated gas displaces the water, creating a dry, protected environment for welding

Welding Rods are coated and hermetically sealed to protect from the environment before being used in welding
Case Study - NEPSYS System

Area to be welded inspected
Prepare area per WPS
Conduct NEPSYS® Weld

Completed NEPSYS® Weld

Install NEPSYS® Habitat
Dewater NEPSYS® Habitat
NEPSYS® Welding
Weld Inspection
Case Study

- 1.5m diameter raked pile
- Approximately 25% of the circumference was damaged at -17m LAT
- Damage to the underside of the pile
- Contacted by client in August
- Grouting of piles in October

Options for repair:
- Removal and Re-piling
- Clamp
- Repair Patch via wet weld
- Reinstatement of Material via dry welding
Welding Qualification

- Base Steel had high Carbon Content 0.18% (CE 0.44%)
- Initial Hardness Testing – Maximum 276HV10

- Weld preparation designed to minimise welding time
- Procedure qualification in the Vertical and Overhead positions over three weeks
- Qualification in Perth witnessed by third party
- Multiple welder qualification
Insert Plate and Habitat Design

- Insert plate design adapted for damage profile, welding procedure
- Habitat design adapted for insert plate profile
- Habitat fabrication (one week)

- Removal of damaged area via water jetting which left edges suitable for welding
- Insert plate installation allowed progression of grouting works
Mobilisation from Perth to Queensland of NEPSYS equipment and personnel
Operations conducted with local dive spread
Diving from the back of a 15m work boat
Nitrox mixture used to ensure longer dive times at the repair depth
Four qualified welders
Approximately 45 hours of welding
2800mm of weld in 16mm plate
Results

- Weld ground flush to the pile
- No surface defects found via Magnetic Particle Inspection or Creep Wave Ultrasonic Testing
- No subsurface defects found via Shear Wave Ultrasonic Testing or Time of Flight Diffraction
- Damaged area fully removed from the pile and reinstated
- Design strength of the pile restored
NEPSYS® Summary

Permanent Integral Welded joints

Diver remains outside of habitat resulting in a **Safer work** environment

**No need** to remove assets from the water, or to use temporary repairs

Habitats designed for **Flexible Geometry** scenarios
Conclusion

- In-situ repair options

- Suitability of Welding Methods

- Questions?
